- 4 (a) Inside a 3D charge, the distribution incomeases as you move toward the surface, increasing
  the field. On the surface, it hits a maximum and
  outside it falls off in an inverse square law fashion
  as the observation distances in crocases.
  - (b) volume charage density,  $l = \frac{20 \times 10^{-9} \text{ C}}{\frac{4\pi}{3} (20 \times 10^{-2} \text{ m})^3}$
  - (c) Using Granss's Law, Qunc = E. DE

For  $r_1 = 5 \times 10^{-2} \text{ m}$ ,  $\vec{p}_E = \oint \vec{E}_{in} \cdot d\vec{a}_1$ 

Note for ST

Application of Grouss's Law

for volume charges may be = 

explained only once

Explained only once

in the beginning.  $= \frac{\mathbb{Q}}{\mathbb{Q}} \times \frac{\mathbb{M}_1^3}{\mathbb{Q}^3}$ 

$$Q_{enc} = Q \times \frac{\gamma_1^3}{R^3}$$

$$= 80 \times 10^{-9} C \times \left(\frac{5 \times 10^{-2} m}{20 \times 10^{-2} m}\right)^3$$

$$= 1.25 \times 10^{-9} C \sim 1.25 nC$$

For 
$$v_2 = 10 \times 10^{-2} \text{m}$$
,  $\overline{\mathcal{D}}_E = \oint \vec{E}_{in} \cdot d\vec{a}_2$ 

Qenc = 
$$\mathbb{R} \times \frac{p_1^3}{\mathbb{R}^3}$$
  
=  $80 \times 10^{-9} \text{C} \times \left(\frac{10 \times 10^{-9} \text{m}}{20 \times 10^{-2} \text{m}}\right)$   
=  $10^{-0} \times 10^{-9} \text{C} \sim 10 \text{ nC}$ .

For 
$$r = 20 \times 10^{-2} \text{m}$$
,  $\bar{\mathcal{D}}_{E} = \oint \vec{E}_{on} \cdot d\vec{a}$  surface

$$Qenc = Q = 80 \times 10^{-9} c$$

(d) At 
$$r_1 = 5 \times 10^{-2} \text{m}$$
,
$$E_1 = \frac{Q r_1}{4\pi\epsilon_0 R^3}$$

$$=4.494\times10^{3}NC^{-1}$$

At 
$$P_2 = 10 \times 10^{-2} \text{m}$$
,  $E_2 = \frac{Q P_2}{4 \pi \epsilon_0 R^3}$ 

$$= 8.988 \times 10^3 \text{ NC}^{-1}$$
At  $P_3 = 20 \times 10^{-2} \text{m}$ ,  $E_3 = \frac{Q}{4 \pi \epsilon_0 R^3} \times 10^3 \text{ NC}^{-1}$
